

Getting Started with Freescall MQX™ RTOS and MDK-ARM Keil™ μVision4®

PRODUCT:	Freescall MQX™ RTOS
PRODUCT VERSION:	4.2.0
DESCRIPTION:	Using MDK-ARM Keil™ μVision4® Tools with Freescall MQX™ RTOS
RELEASE DATE:	April, 2015

1 Read Me First

This document describes steps required to configure the MDK-ARM Keil™ μ Vision4® development tools and use it to build, run, and debug applications of the Freescale MQX RTOS operating system. See the *Getting Started with Freescale MQX™ RTOS* (document MQXRTOSGS) and other user documentation included within the latest Freescale MQX RTOS installation for more details not specifically related to ARM® development tools.

Get the latest Freescale MQX RTOS at freescale.com/mqx.

Additionally, you can find more information related to the Kinetis platform support in μ Vision4 tools in the arm.com/files/pdf/Kinetis_LAB.pdf document.

2 Building the MQX RTOS Libraries and example application

See Chapter 3 of the *Getting Started with Freescale MQX™ RTOS* (document MQXGSRTOS) for details on generic build process and compile-time configuration. This document concentrates on steps specific to the Keil® MDK tool chain only.

For MQX RTOS v4.2.0, each example/demo application comes with one multi-project workspace file which contains the path to the example/demo project file and all the dependent MQX RTOS library project files. The user should import that file into Keil workspace to run the application.

For example with Hello World example of MQX RTOS for TWR-K70F120M BSP, the multi-project workspace is located in the folder:

```
<mqx_install_dir>/examples/hello/build/uv4/hello_twrk70f120m/hello_twrk70f120m.uvmpw
```

To import this file into the Keil workspace, go to menu>Project/Open Project...

All MQX RTOS configuration files are also *indirectly* used by other core components, such as RTCS, MFS, Shell, and so on. “Indirectly” means that the MQX RTOS PSP and BSP must be built first, which causes the configuration file to be copied into the output (lib) directory. The other components, then, include the configuration file from the `/lib` output directory.

Caution: Until the PSP or BSP libraries are rebuilt, configuration changes made in the `user_config.h` file are not used by any other MQX RTOS component. On the other hand, after the PSP and BSP libraries are re-compiled with a new configuration, it is important to recompile the other libraries so the compiled code is consistent with the configuration file. See the next section for more details.

2.1 Build Process

After any change to the compile-time user configuration file or MQX RTOS kernel source files, the MQX RTOS libraries need to be rebuilt. The build process is similar for all core components:

The output directory for any MQX RTOS library component is `<install_dir>/lib/<board>.<compiler>/<component>`

For example the MQX RTOS PSP and BSP libraries for the TWR-K60N512 board are copied into the `/lib/twrk60n512.uv4/psp` and `/lib/twrk60n512.uv4/bsp` directories after successful build process.

All public header files needed by an application to make use of the library are also copied from internal include folders to the same output directory.

During PSP or BSP build process, also the `user_config.h` file and other header files from the `config/<board>` and `config/common` directories are copied into the `lib/<board>.uv4` output directory.

Other components like RTCS, MFS, Shell or USB use the copied configuration files only.

Applications which make use of any MQX RTOS library do not need to make any reference to the internal source and include paths of the MQX RTOS components. Applications use solely the paths in the `/lib/<board>.<compiler>` as the search paths for header files or libraries.

To summarize the points above, follow the guidelines below when re-building the MQX RTOS libraries:

After any change to the `/config/common/user_config.h` file, all MQX RTOS libraries should be rebuilt.

The PSP and BSP libraries must be build first, before the MFS, RTCS, USB, Shell, and other libraries.

Important: No changes should be made to header files in the output build directory (`/lib`). The files get overwritten any time the libraries are built.

2.2 Build Configurations

Each μ Vision4 project in Freescale MQX RTOS contains multiple compiler/linker configurations (so called build targets).

Two different types of build targets exist for different compiler optimization settings:

Debug – the compiler optimizations are turned off or set to low. The compiled code is easy to debug but may be less effective and much larger than the Release build. All output libraries have `_d` postfix in the file name (e.g., `rtcs_<board>_d.a`).

Release – the compiler optimizations are set to maximum. The compiled code is very hard to debug and should be used for final applications only. There is no postfix in the output file name (e.g., `rtcs_<board>.a`).

Build target name of any MQX RTOS application project makes a reference either to **Debug** or **Release** builds of the core libraries. Target names also specify board memory configuration which gets built. For example:

Devices with internal Flash memory (e.g., TWR-K60N512):

Int. Flash Release – this target is suitable for final application deployment. When programmed to Flash, the application starts immediately after reset. Variables are allocated in internal SRAM memory.

Int. Flash Debug – same as above, only the Debug-compiled libraries are used. This target is suitable for debugging before deployment. On boards without external memory, this is the only target suitable for debugging larger applications.

Boards and devices with internal Flash memory and additional external RAM for data (TWR-K70F120M):

Int Flash <mem>Data Debug – The name of each target additionally defines a memory used as the default data storage. For example, the application built with target named “Int Flash DDRData Debug” executes code out of internal Flash memory and uses the DDR memory for data storage.

Boards with external RAM memory:

Ext. Ram Debug – solely for debugging purposes with code located in external RAM memory. Both code and variables are located in this external memory. Application executable is loaded to RAM automatically by the debugger.

See the BSP-specific information included in the latest MQX RTOS installation for a description of build targets specific to particular board.

2.2.1 Batch Build in μ Vision4 IDE

With μ Vision4, the MQX RTOS build process can be simplified by using the Batch Build feature. For each example application, the dependent MQX RTOS library components are imported to the Keil workspace when we open the multi-project workspace. An example is the demo `web_hvac` application for TWR-K60N512 BSP. The multi-project workspace is in folder

```
<mqx_install_dir>/demo/web_hvac/build/uv4/web_hvac_twrk60n512/web_hvac_twrk60n512
.uvmpw
```

Figure 1 µVision4 workspace

The MQX RTOS library components must be built before the example/application project can be built. Keil MDK supports Batch Build configurations which can be used to build all MQX RTOS libraries at once.

Go to menu “Project / Batch Build...” in the µVision4 IDE.

Select libraries and targets to build. Note that the projects are sorted in alphabetical order but this does not affect the build order. The build order is set properly in the Multi-Project Workspace definition.

Select the libraries and targets you want to build in a batch. It is recommended to rebuild at least all Debug or all Release targets at once.

Press the “Rebuild” button to start the batch build process.

2.3 Build example/application project

In µVision4 IDE build each project one by one by selecting the project and clicking the “Build” button or the “Rebuild” button. For example to build the web_hvac application, first set it as the active project. Select the desired build target and the memory configuration to build. Click the “Rebuild” button.

Figure 2 Set as active project

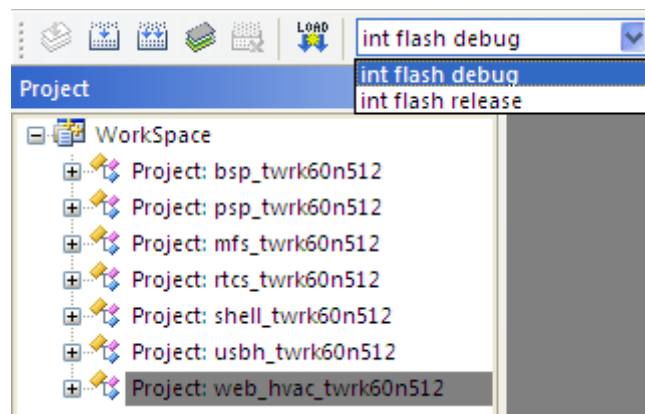

Figure 3 init flash debug

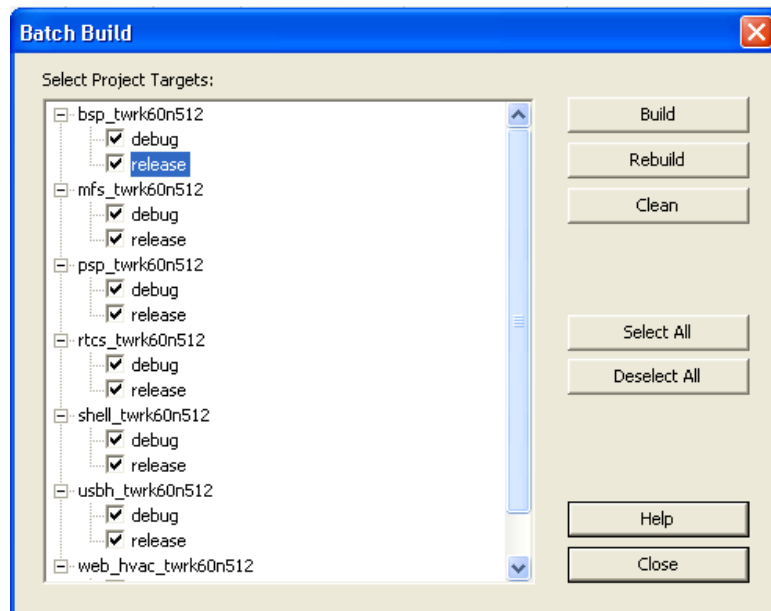

Figure 4 Batch build

3 MQX RTOS Task Aware Debugging

MQX RTOS Task Aware Debugging plug-in (TAD) is an optional extension to a debugger tool which helps to visualize internal MQX RTOS data structures, task-specific information, I/O device drivers, and other MQX RTOS context data.

The MQX RTOS TAD plugin for μ Vision4 is called MQX RTOS-Viewer and is installed by an add-on installer included with the MQX RTOS installation.

3.1 Debugging MQX RTOS Applications in μ Vision4

Loading and debugging MQX RTOS applications is an easy task with ARM Keil μ Vision4 tool and it is not really different from debugging classic non-OS applications. Ensure that you select the correct debugger interface in the project options and correct processor configuration.

3.1.1 Using OSJTAG Debugger Connection

The MQX RTOS example projects are configured by default to use on-board OSJTAG debugger connection. Check the debugger connection settings in project options, the “Debug” tab:

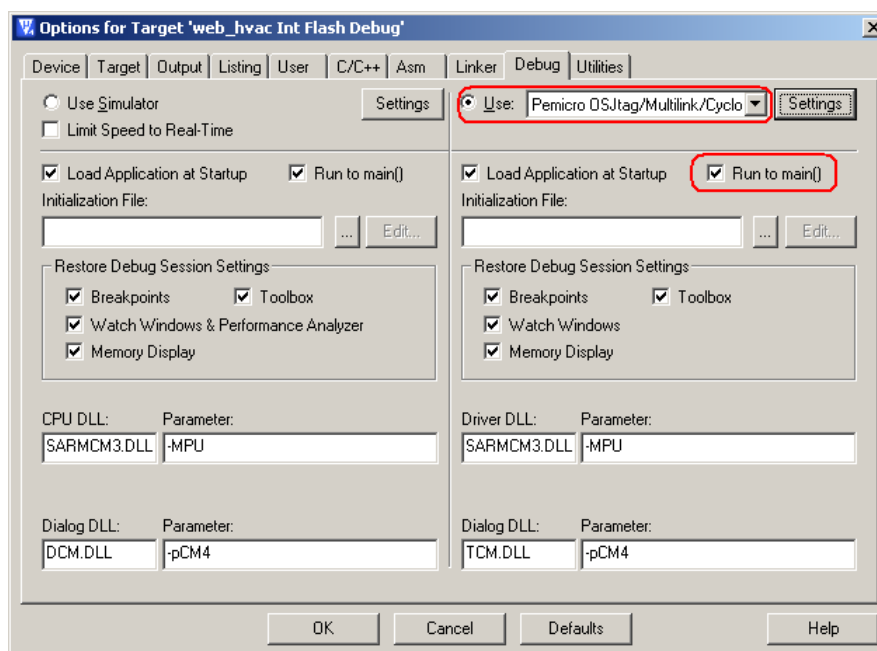

Figure 5 Options for target “web_hvac”

You may also want to select the “Run to main()” option which forces the debugger to execute the startup code until the main C entry point function is reached. When this option remains unchecked, the debugger stops execution at the first executed instruction at the reset vector.

In either case, be aware that, at such breakpoint, the MQX Operating System is not yet fully running so use of TAD plugin features, as described in subsequent sections, is limited.

When a MQX RTOS application is compiled and linked with all MQX RTOS libraries, press the “Start/Stop Debug Session...” button on the toolbar to initiate the debugger session.

With the OSJTAG debugger connection, the first time you try to execute the application the user is prompted to select the target processor. Then, in the connection manager, press the “Connect” (Reset) button to establish connection between the PC Host and target board.

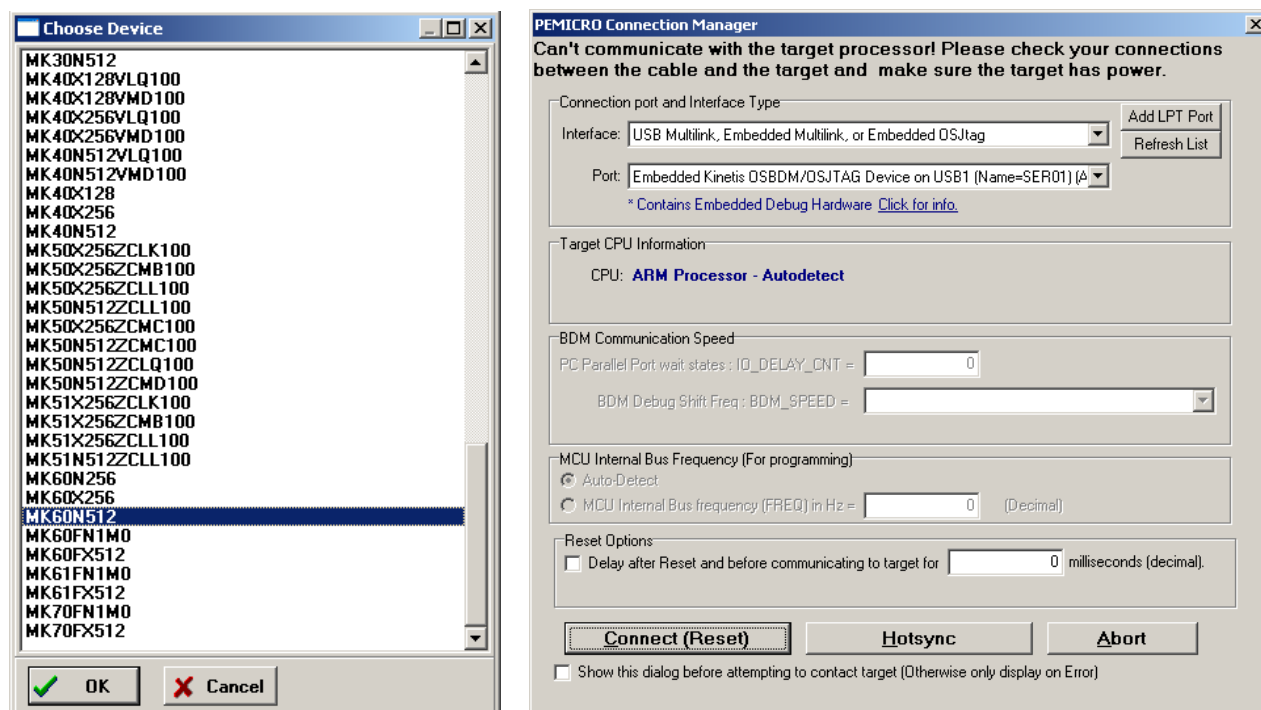

Figure 6 Connection manager

Use the “Yes” button to load application to target Flash memory and wait until the Flashing process finishes:

Figure 7 Erase and program Flash

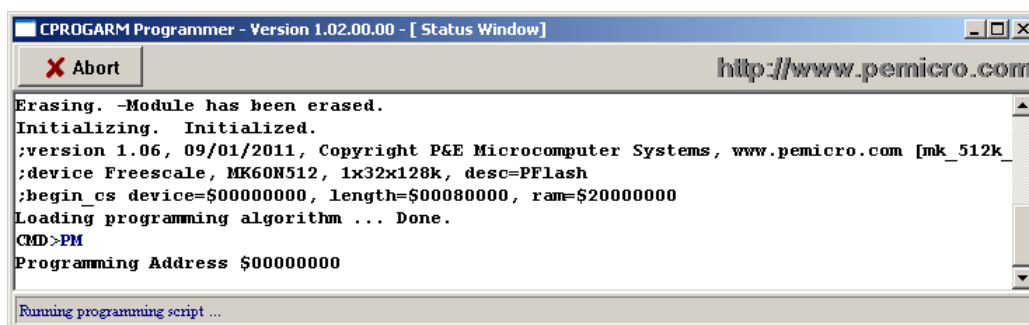

Figure 8 Status window

When the application is loaded, it is executed under the debugger and stops at initial breakpoint:

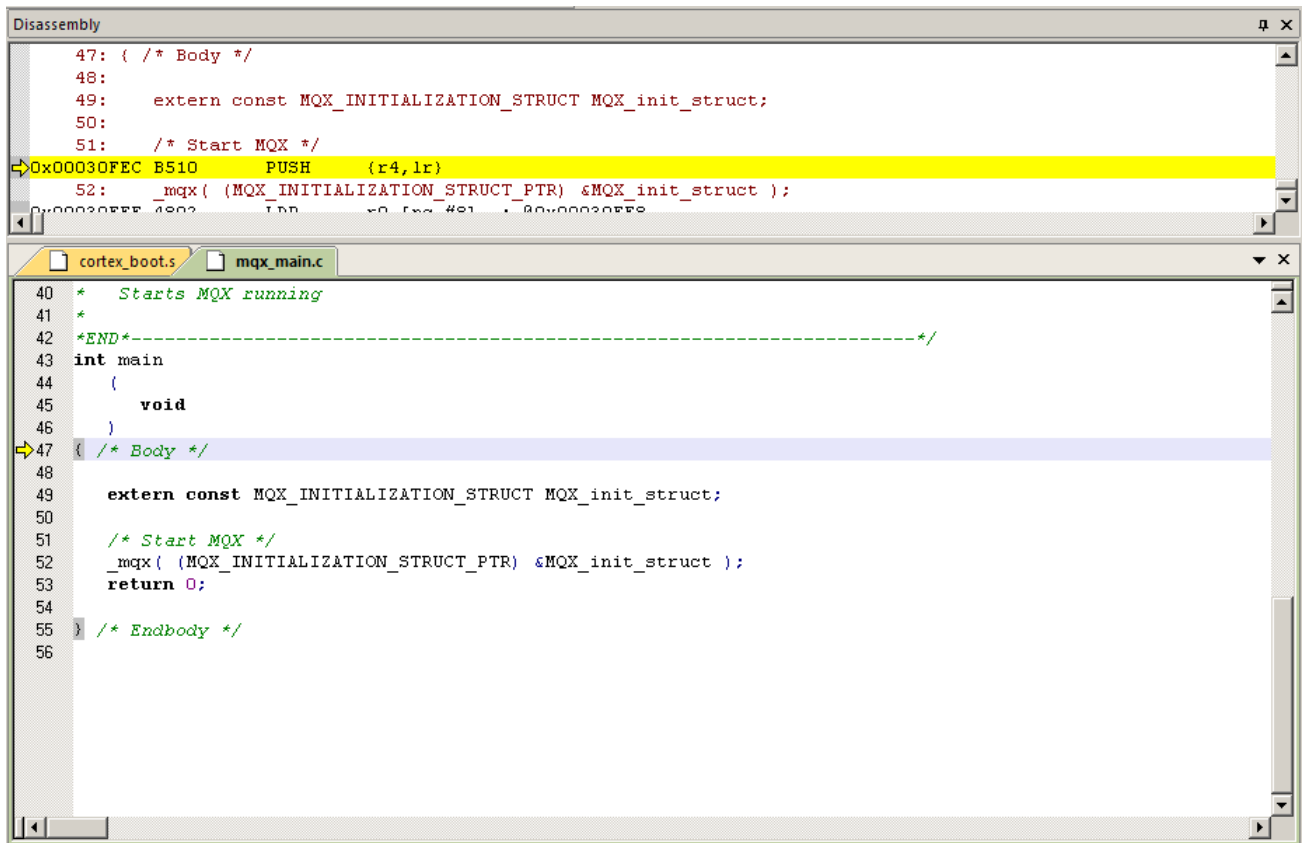

Figure 9 Disassembly

3.1.2 Using ARM Keil ULINK® Debugger Connection

Use of ULINK® or ULINK_{pro} debugger interface requires additional configuration steps as described below.

In the project options, the “Debug” tab, select the ULINK connection, press the “Settings” button and make sure that the Connection options are set as shown in the image below:

Figure 10 Project options

In the same setup dialog, select the “Flash Download” tab and add programming algorithm suitable for the target processor:

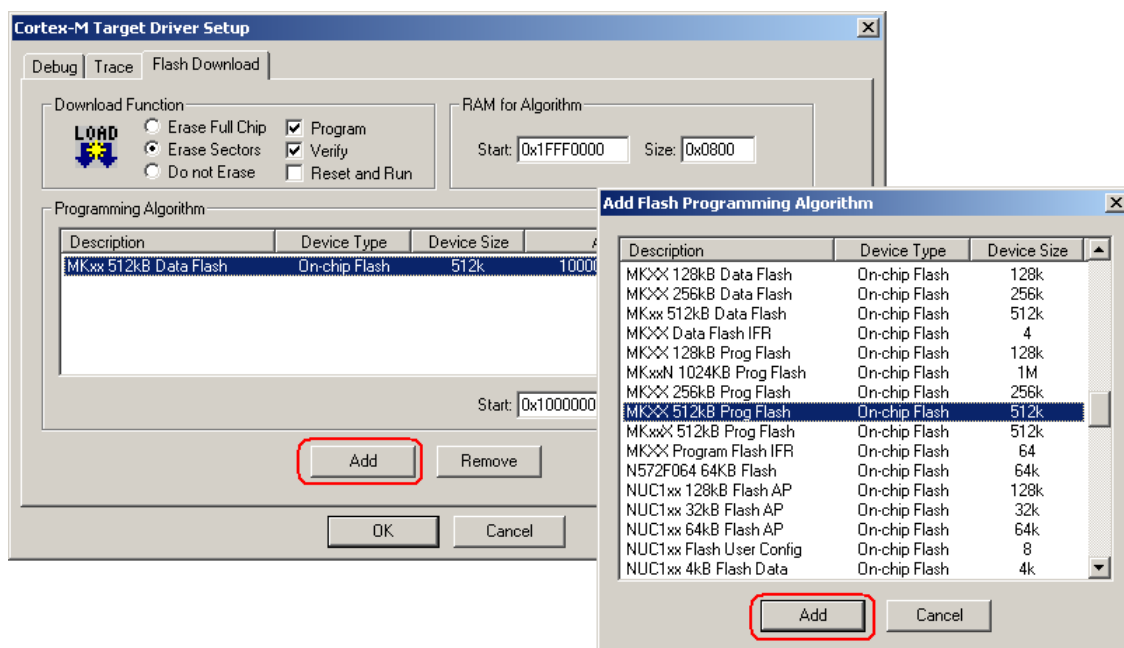

Figure 11 Driver setup

Select the Flash algorithm according to the following table:

Description	Target processor
MKXX 256kB Prog Flash	TWR-K40X256 Program Flash (0x00000000 – 0x00003FFFF)
MKXX 256kB Data Flash	TWR-K40X256 Data Flash (0x10000000 – 0x10003FFFF)
MKXX 512kB Prog Flash	TWR-K60N512 Program Flash (0x00000000 – 0x00007FFFF)
MKxxN 1024KB Prog Flash	TWR-K70F120M, TWR-K64F120M, FRDM-K64F Program Flash (0x00000000 – 0x0000FFFFFF)

Back in the Options dialog, select the “Utilities” tab and make sure that the “Update Target before Debugging” option is selected:

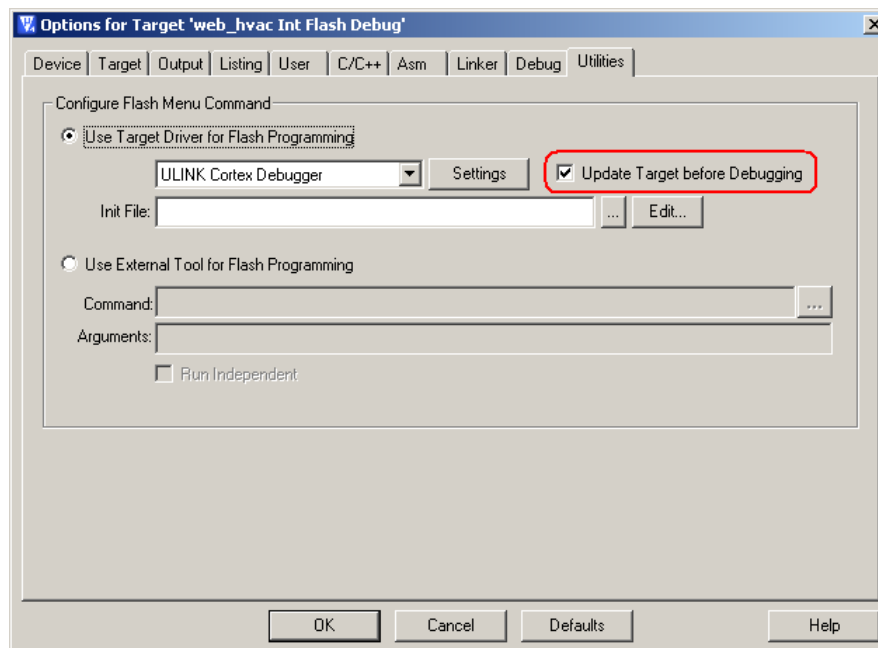

Figure 12 Options dialog

With the settings selected as described above, press the “Start/Stop Debug Session...”  button to initiate the debugger session. It automatically loads the application to the target Flash memory and executes the application until it reaches initial breakpoint.

3.2 MQX RTOS-Viewer TAD Debugger Plug-in

3.2.1 Installing μ Vision4 TAD

The MQX RTOS-Viewer TAD plug-in is installed with add-on installer distributed inside the MQX RTOS installation package. The add-on installer is executed automatically during the MQX RTOS installation if μ Vision4 tool exists and if the Keil extensions are selected in MQX RTOS setup.

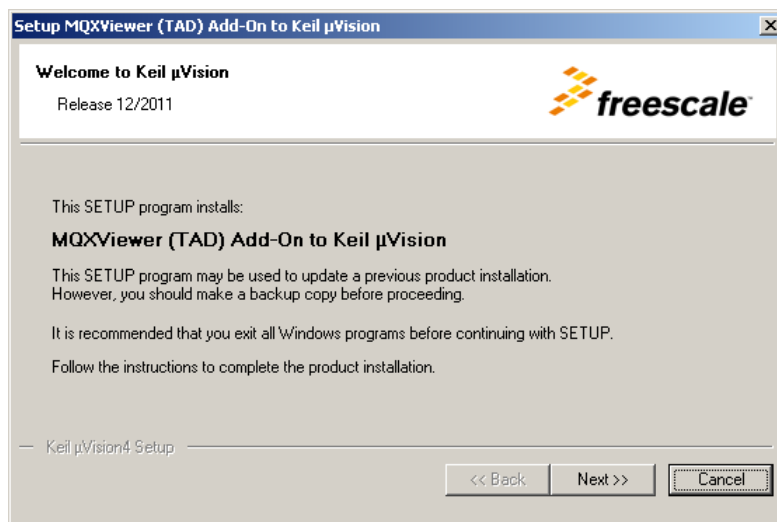

Figure 13 MQX RTOS viewer

If you need to install the MQX RTOS-Viewer TAD plug-in manually after MQX RTOS has been installed, simply start the add-on installer by running the following:

```
<MQX Installation>\tools\keil_extensions\uVision4\MDK_MQX-Viewer_AddOn.exe
```

The add-on installer installs the plug-in as the `<uVision4>\ARM\BIN\MQX-Viewer.dll` file and registers it in the main `TOOLS.ini` file as `RTOSx=MQX-Viewer.dll ("Freescale MQX")` in the `[ARM]` and `[ARMADS]` sections.

When MQX RTOS-Viewer is installed, the MQX RTOS application projects should be set to use this plug-in during debugger sessions. In project options, select the “Target” tab and select the “Freescale MQX RTOS” operating system:

Figure 14 Options in MQX RTOS viewer

3.2.2 Using MQX RTOS-Viewer TAD Screens

Several TAD “screens” may be opened during the debugging session when using the MQX RTOS menu or RTCS menu in the μVision “OS Support” menu.

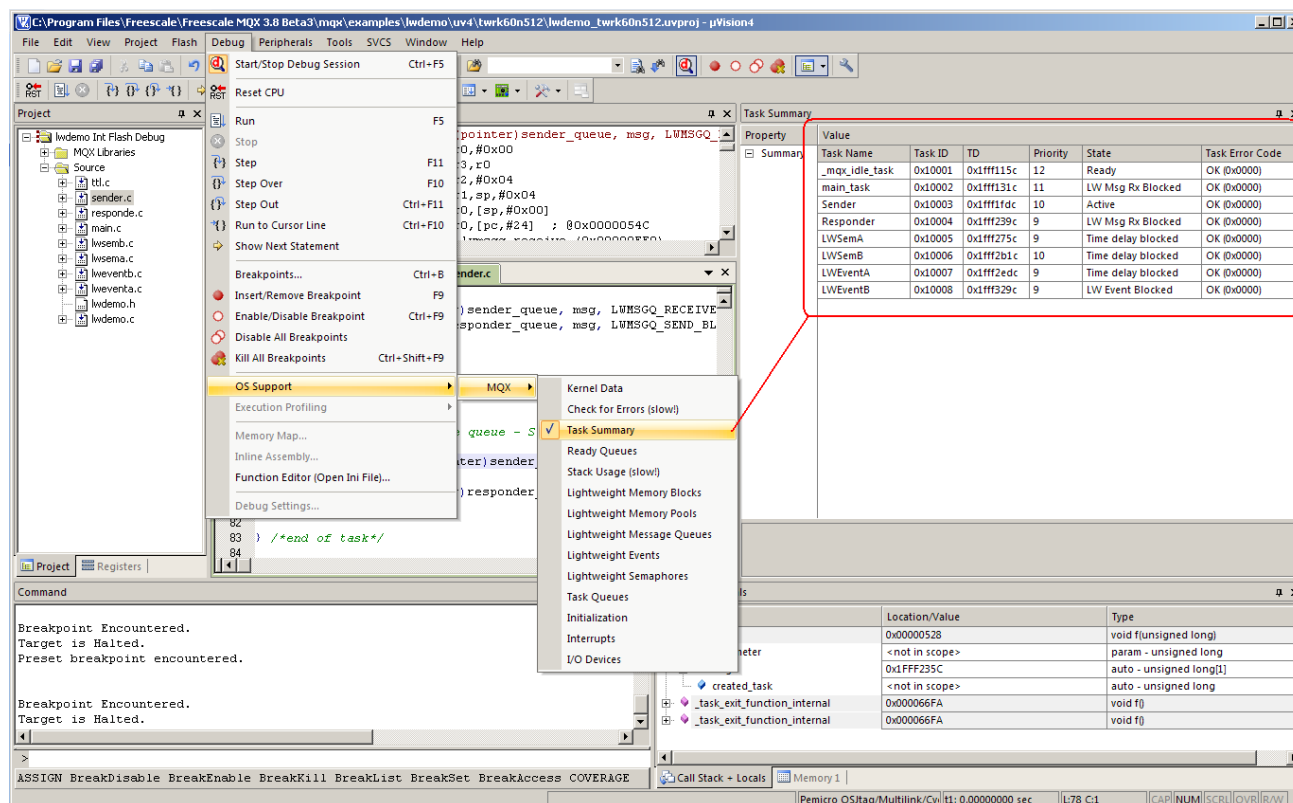

Figure 15 OS support menu

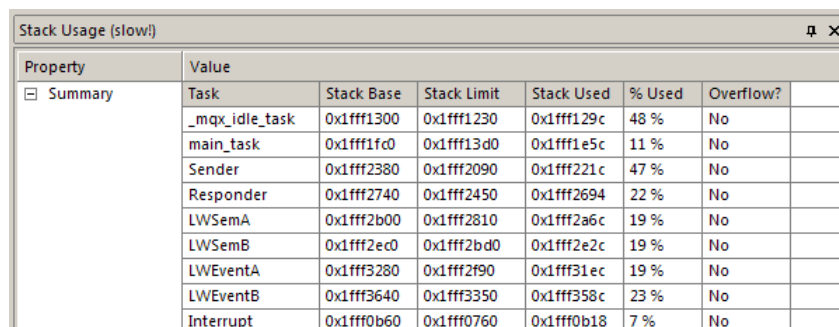

The most helpful and frequently used screens are shown in the images below:

Task Summary – overview of all tasks created in the MQX RTOS application.

Task Summary						
Property	Value					
Summary	Task Name	Task ID	TD	Priority	State	Task Error Code
	_mqx_idle_task	0x10001	0x1fff115c	12	Ready	OK (0x0000)
	main_task	0x10002	0x1fff131c	11	LW Msg Rx Blocked	OK (0x0000)
	Sender	0x10003	0x1fff1fdc	10	Active	OK (0x0000)
	Responder	0x10004	0x1fff239c	9	LW Msg Rx Blocked	OK (0x0000)
	LWSemA	0x10005	0x1fff275c	9	Time delay blocked	OK (0x0000)
	LWSemB	0x10006	0x1fff2b1c	10	Time delay blocked	OK (0x0000)
	LWEventA	0x10007	0x1fff2edc	9	Time delay blocked	OK (0x0000)
	LWEventB	0x10008	0x1fff329c	9	LW Event Blocked	OK (0x0000)

Figure 16 Task summary

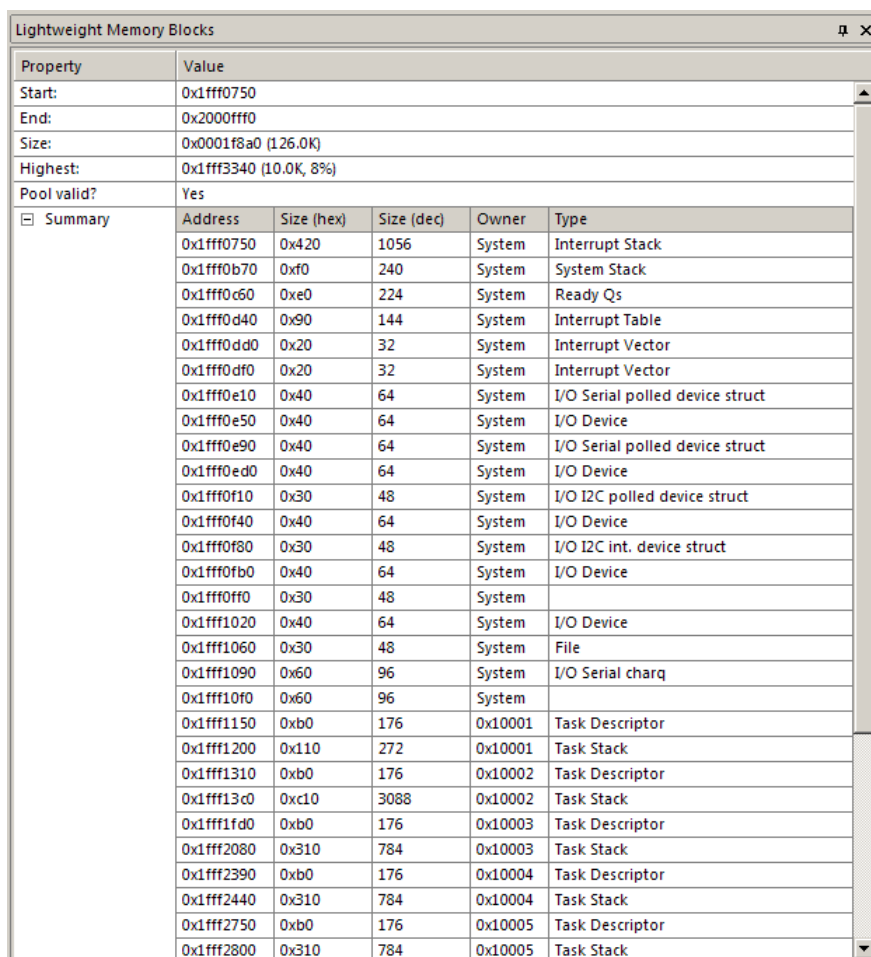

Stack Usage Summary – displays information about interrupt and task stacks. Typically, stack overflow is a root cause for the vast majority of problems in MQX RTOS user applications.

Property	Value					
[-] Summary	Task	Stack Base	Stack Limit	Stack Used	% Used	Overflow?
	_mqx_idle_task	0x1fff1300	0x1fff1230	0x1fff129c	48 %	No
	main_task	0x1fff1fc0	0x1fff13d0	0x1fff1e5c	11 %	No
	Sender	0x1fff2380	0x1fff2090	0x1fff221c	47 %	No
	Responder	0x1fff2740	0x1fff2450	0x1fff2694	22 %	No
	LWSemA	0x1fff2b00	0x1fff2810	0x1fff2a6c	19 %	No
	LWSemB	0x1fff2ec0	0x1fff2bd0	0x1fff2e2c	19 %	No
	LWEventA	0x1fff3280	0x1fff2f90	0x1fff31ec	19 %	No
	LWEventB	0x1fff3640	0x1fff3350	0x1fff358c	23 %	No
	Interrupt	0x1fff0b60	0x1fff0760	0x1fff0b18	7 %	No

Figure 17 Stack usage summary

Lightweight Memory Block Summary – displays address, size, and type information about each memory block allocated in the default memory pool by the MQX RTOS system or applications. Additional memory pools, if used, may be displayed using the “Lightweight Memory Pools” screen.

Property	Value				
Start:	0x1fff0750				
End:	0x2000fff0				
Size:	0x0001f8a0 (126.0K)				
Highest:	0x1fff3340 (10.0K, 8%)				
Pool valid?	Yes				
[-] Summary	Address	Size (hex)	Size (dec)	Owner	Type
	0x1fff0750	0x420	1056	System	Interrupt Stack
	0x1fff0b70	0xf0	240	System	System Stack
	0x1fff0c60	0xe0	224	System	Ready Qs
	0x1fff0d40	0x90	144	System	Interrupt Table
	0x1fff0dd0	0x20	32	System	Interrupt Vector
	0x1fff0df0	0x20	32	System	Interrupt Vector
	0x1fff0e10	0x40	64	System	I/O Serial polled device struct
	0x1fff0e50	0x40	64	System	I/O Device
	0x1fff0e90	0x40	64	System	I/O Serial polled device struct
	0x1fff0ed0	0x40	64	System	I/O Device
	0x1fff0f10	0x30	48	System	I/O I2C polled device struct
	0x1fff0f40	0x40	64	System	I/O Device
	0x1fff0f80	0x30	48	System	I/O I2C int. device struct

	0x1fff2750	0xb0	176	0x10005	Task Descriptor
	0x1fff2800	0x310	784	0x10005	Task Stack

Figure 18 Lightweight memory blocks

Lightweight Semaphores, Lightweight Events – displays address and status of synchronization objects created by the MQX RTOS system or application. When a synchronization object is allocated as a global or static variable in the system, as an array element, or as a structure member allocated as a global or static variable, the TAD plug-in also displays the symbolic name of the object.

Lightweight Semaphores								
Property		Value						
 Summary	LWSem	Valid	Value	Waiting#	Symbol			
	0x1fff05bc	Yes	1	0	mqx_kernel_data->COMPONENT_CREATE_LWSEM			
	0x1fff0530	Yes	1	0	mqx_kernel_data->TASK_CREATE_LWSEM			
	0x1fff0658	Yes	1	0	mqx_kernel_data->IO_LWSEM			
	0x1fff007c	Yes	8	0	lwsem			
Lightweight Events								
Property		Value						
 Summary	LWEvent	Valid	BitMask	Auto Clear	Waiting#	Symbol		
	0x1fff0058	Yes	0x00000000	No	1	lwevent		

Figure 19 Lightweight semaphores

4 Using the MQX RTOS Debug/I/O Driver with μ Vision4 IDE

MQX RTOS provides the Debug/I/O driver allowing the processor to communicate with PC host computer via debugger probe. The Debug/I/O channel can also be used as a default console for standard input and output operations. For more details about this driver, see *Getting Started with Freescale MQXTM RTOS* (document MQXGSRTOS).

The MQX RTOS currently supports ARM[®] Cortex[®]-M Semihost and ITM technologies. The μ Vision4[®] IDE supports the ITM communication channel over the ULINK[®] and ULINK^{pro} debugger interfaces for both input and output directions.

To set up the project for Debug/I/O communication, open the project options at the “Debug” tab, select the ULINK connection, press the “Settings” button and make sure the SWJ and Port options are set as shown in the image below:

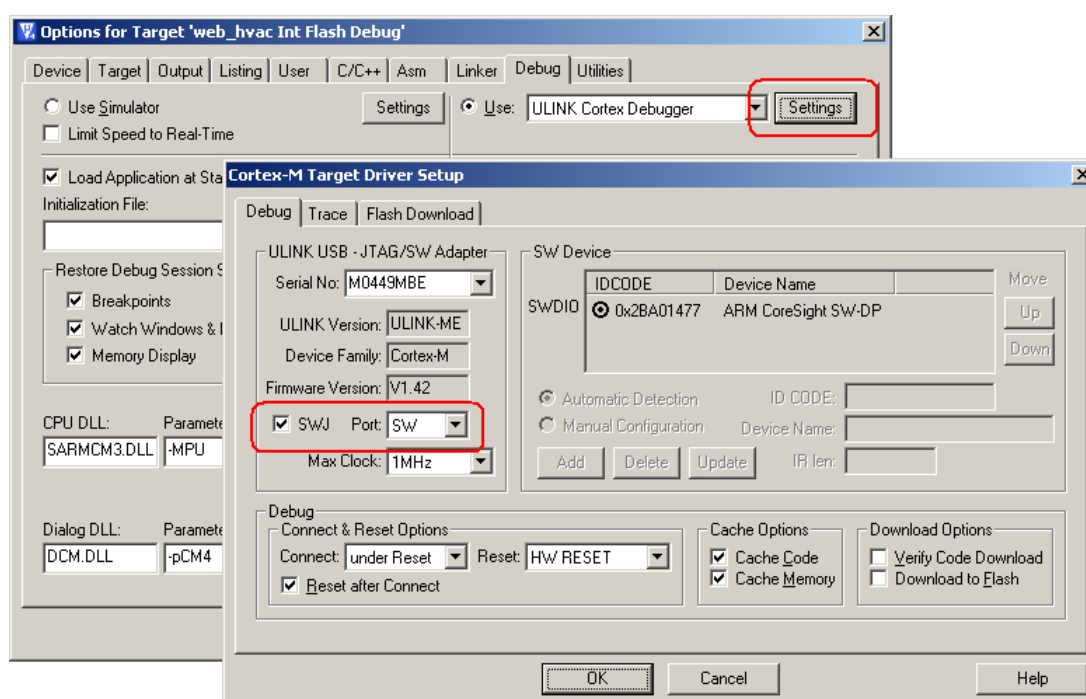

Figure 20 Debug tab

Switch to Trace tab and check “Trace enable”, ITM Port 0, and other settings as shown in the image below. The Core Clock should be set according to the real CPU setting:

Figure 21 Trace tab

For the ULINKpro debugger interface, select the Manchester coding of the Trace port as shown below:

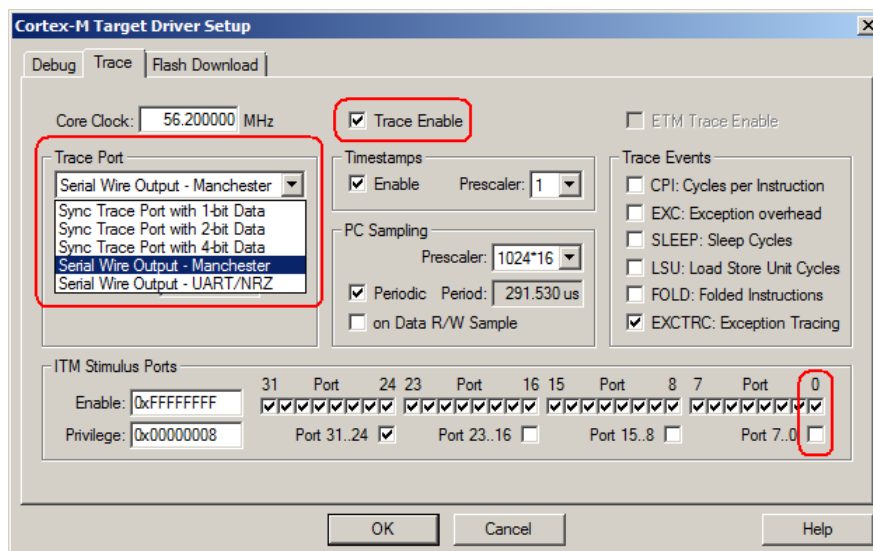

Figure 22 Trace tab

The console window can be opened during a debug session using the “*View / Serial Windows / Debug (printf) Viewer*” menu.

Figure 23 Debug viewer
